

I, Keila Holcombe, did not use GenAI to generate code for HW1.

However, I have used some online resources such as a website from Microsoft and GeeksforGeeks to understand the documentation for comment block, some of the operations I can do for C#, and referenced how to do the PrintInOrderTraversal and GetNumberOfLevels methods.

Below are the links to the websites I have referenced. I have also added comments above about the things I referenced on Visual Studio with the link to the referenced site.

I don't know C# much, so I searched up some C# code to understand basic C# syntax, such as how to write the main method, how to print works, and some math operations such like for log₂ and rounding. The following are the links to the reference:

- For basic C# syntax: [Arithmetic operators - C# reference | Microsoft Learn](#)
- Mathematical operations log(): [C# | Math.Log\(\) Method - GeeksforGeeks](#)
- Mathematical operations Ceiling(): [C# | Math.Ceiling\(\) Method - GeeksforGeeks](#)

To understand how to do a comment block in proper style, I visited Microsoft website to learn it:

- [Documentation comments - C# language specification | Microsoft Learn](#)

I also referenced GeeksforGeeks to understand how to do some operations for how to print in order traversal and getting the number of levels. The following are the links to the references:

- In order traversal: [Binary Search Tree \(BST\) Traversals – Inorder, Preorder, Post Order - GeeksforGeeks](#)
- Number of levels: [Maximum Depth or Height of a Binary Tree - GeeksforGeeks](#)
